ENGR-1100 Introduction to Engineering Analysis

Lecture 20
THE METHOD OF SECTIONS

Today’s Objectives:

Students will be able to determine:

1. Forces in truss members using the method of sections.

In-Class Activities:

- Reading Quiz
- Applications
- Method of Sections
- Concept Quiz
- Group Problem Solving
- Attention Quiz
APPLICATIONS

Long trusses are often used to construct large cranes and large electrical transmission towers.

The method of joints requires that many joints be analyzed before we can determine the forces in the middle of a large truss.

So another method to determine those forces is helpful.
In the method of sections, a truss is divided into two parts by taking an imaginary “cut” (shown here as a-a) through the truss.

Since truss members are subjected to only tensile or compressive forces along their length, the internal forces at the cut members will also be either tensile or compressive with the same magnitude as the forces at the joint. This result is based on the equilibrium principle and Newton’s third law.
1. Decide how you need to “cut” the truss. This is based on: a) where you need to determine forces, and, b) where the total number of unknowns does not exceed three (in general).

2. Decide which side of the cut truss will be easier to work with (minimize the number of external reactions).

3. If required, determine any necessary support reactions by drawing the FBD of the entire truss and applying the E-of-E.
4. Draw the **FBD** of the selected part of the cut truss. You need to indicate the unknown forces at the cut members. Initially, you may assume all the members are in tension, as done when using the method of joints. Upon solving, if the answer is positive, the member is in tension as per the assumption. If the answer is negative, the member must be in compression. (Please note that you can also assume forces to be either tension or compression by inspection as was done in the figures above.)
5. Apply the scalar **equations of equilibrium** (E-of-E) to the selected cut section of the truss to solve for the unknown member forces. **Please note,** in most cases it is possible to write one equation to solve for one unknown directly. So look for it and take advantage of such a shortcut!
EXAMPLE

Given: Loads as shown on the truss.

Find: The force in members KJ, KD, and CD.

Plan:

a) Take a cut through members KJ, KD and CD.
b) Work with the left part of the cut section. Why?
c) Determine the support reactions at A. What are they?
d) Apply the E-of-E to find the forces in KJ, KD and CD.
Analyzing the entire truss for the reactions at A, we get
\[ \sum F_X = A_X = 0. \]
A moment equation about G to find \( A_Y \) results in:
\[ \sum M_G = A_Y (18) - 20 (15) - 30 (12) - 40 (9) = 0; \quad A_Y = 56.7 \text{ kN} \]

Now take moments about point D. Why do this?
\[ + M_D = -56.7 (9) + 20 (6) + 30 (3) - F_{KJ} (4) = 0 \]
\[ F_{KJ} = -75.1 \text{ kN} \quad \text{or} \quad 75.1 \text{ kN (C)} \]
Now use the x and y-directions equations of equilibrium.

\[ \uparrow + \sum F_Y = 56.7 - 20 - 30 - \left(\frac{4}{5}\right) F_{KD} = 0; \]

\[ F_{KD} = 8.38 \text{ kN (T)} \]

\[ \rightarrow + \sum F_X = (-75.1) + \left(\frac{3}{5}\right)(8.38) + F_{CD} = 0; \]

\[ F_{CD} = 70.1 \text{ kN (T)} \]
1. In the method of sections, generally a “cut” passes through no more than _____ members in which the forces are unknown.
   A) 1  B) 2  C) 3  D) 4

2. If a simple truss member carries a tensile force of T along its length, then the internal force in the member is ______.
   A) Tensile with magnitude of T/2
   B) Compressive with magnitude of T/2
   C) Compressive with magnitude of T
   D) Tensile with magnitude of T
1. Can you determine the force in member ED by making the cut at section a-a? Explain your answer.

A) No, there are 4 unknowns.
B) Yes, using $\Sigma M_D = 0$.
C) Yes, using $\Sigma M_E = 0$.
D) Yes, using $\Sigma M_B = 0$. 
2. If you know $F_{ED}$, how will you determine $F_{EB}$?

A) By taking section b-b and using $\sum M_E = 0$
B) By taking section b-b, and using $\sum F_X = 0$ and $\sum F_Y = 0$
C) By taking section a-a and using $\sum M_B = 0$
D) By taking section a-a and using $\sum M_D = 0$
ATTENTION QUIZ

1. As shown, a cut is made through members GH, BG and BC to determine the forces in them. Which section will you choose for analysis and why?

A) Right, fewer calculations.

B) Left, fewer calculations.

C) Either right or left, same amount of work.

D) None of the above, too many unknowns.
2. When determining the force in member HG in the previous question, which one equation of equilibrium is the best one to use?

A) $\Sigma M_H = 0$

B) $\Sigma M_G = 0$

C) $\Sigma M_B = 0$

D) $\Sigma M_C = 0$
GROUP PROBLEM SOLVING

**Given:** Loads as shown on the truss.

**Find:** The force in members GB and GF.

**Plan:**

a) Take the cut through members GF, GB and AB.

b) Analyze the left section. Determine the support reactions at A. Why?

c) Draw the FBD of the left section.

d) Apply the equations of equilibrium (if possible, try to do it so that every equation yields an answer to one unknown.)
1) Determine the support reactions at A by drawing the FBD of the entire truss.

\[ \sum F_X = A_X = 0 \]

\[ \sum M_D = -A_Y (28) + 600 (18) + 800 (10) = 0; \]
\[ A_Y = 671.4 \text{ lb} \]

Why is \( A_X \) equal zero by inspection?
2) Analyze the left section.

\( + \sum M_B = -671.4 \text{ (10)} + F_{GF} \text{ (10)} = 0; \)
\[ F_{GF} = 671 \text{ lb (C)} \]

\( + \sum F_Y = 671.4 - F_{GB} = 0; \)
\[ F_{GB} = 671 \text{ lb (T)} \]
